**David R. Tollafield DPodM BSc FPodA, Linda M. Merriman MPhil DPodM MCHS Cert : Clinical Skills in Treating the Foot, 1e** before purchasing it in order to gauge whether or not it would be worth my time, and all praised Clinical Skills in Treating the Foot, 1e:

In one volume, here's everything the podiatrist needs to know about the principles and practice of treating the foot. This text covers the traditional and modern methods for managing foot conditions with emphasis on the need for a holistic approach, providing an understanding of the role of other health care professionals in this area of therapy. The reader can use this text to design individually tailored holistic health plans built on the results of clinical examinations and assessment. Case studies make it easier for the reader to apply theory to practice and the structure of the book is designed to facilitate learning, revision and ready reference. And the liberal use of illustrations and learning devices

makes the text more readable and accessible. The text looks at all appropriate methods of clinical management based on the following 5 basic principles: - pharmacology - operative techniques (subcutaneous and percutaneous methods) - mechanical therapies - physical therapies - footwear adaptation Details of pathology are considered where this helps to explaining why one method of treatment may be preferable to another. Relevant physiology, pharmacology and orthopaedic principles are discussed or referred to as necessary, although the book is not intended to supplant the need for textbooks on these subjects. There is no up-to-date British book on the clinical skills relevant to treating the foot and this title fills a very real gap in the market. Comprehensive coverage of the traditional and modern methods of clinical management for foot conditions Covers the total care of the foot, including orthopaedic and medical means of management Written by a multidisciplinary team of experts in the treatment and management of foot conditions Emphasises the need for a holistic approach to clinical management and the design of treatment plans Designed to facilitate the integration of information gained from clinical examination into treatment plans tailored for the individual patient Illustrated with case histories as a guide to putting the principles explained in the text into clinical practice Divided into three comprehensive sections covering the principles of patient management, therapeutic methods and the application of treatment in practice All chapters in section 2 (on specific methods of therapy) have standardised structure and use of headings for easy reference Incorporates generous use of summaries, lists of key points, etc to assist learning Fully referenced with additional lists of further reading Line drawings, photographs, flow diagrams and tables illustrate and supplement the text
