**Barbara A. Israel, Eugenia Eng, Amy J. Schulz, Edith A. Parker, David Satcher : Methods in Community-Based Participatory Research for Health** before purchasing it in order to gage whether or not it would be worth my time, and all praised Methods in Community-Based Participatory Research for Health:

0 of 0 people found the following review helpful. Got tools?By Kau'i BaumhoferCBPR is all about putting the power back in the people's hands and this book certainly furthers that tradition. As well as I can remember most, if not all, of the readings included in this book were written by teams of academics and community partners.Have you ever read a study and nearly died because you wanted to see a copy of the survey used, but couldn't find it anywhere on the internet? Look no further. The appendices of this book are filled with survey, community checklists, field note guide, and examples of process and intervention evaluation questions.Full disclosure: I had the honor of reading this book while studying under Drs. Israel and Schulz so I'm a little biased...0 of 0 people found the following review helpful.

Good text, great case studies  
By swizzler  
Got this for a class before even really understanding the difference between community-based research and community-based participatory research. This lays out the significance, theoretical backing, and actual practices of this research. The authors are highly regarded in the CBPR world, and offer a valuable perspective for making real, sustained gains in health. Very good for any activists interested in how to translate their work to research or just to work with researchers.

By Deanna  
Very easy to follow descriptions of relative and recent community based participatory research evaluations. Really helped my understanding.

Written by distinguished experts in the field, this book shows how researchers, practitioners, and community partners can work together to establish and maintain equitable partnerships using a Community-Based Participatory Research (CBPR) approach to increase knowledge and improve health and well-being of the communities involved. CBPR is a collaborative approach to research that draws on the full range of research designs, including case study, etiologic, longitudinal, experimental, and nonexperimental designs. CBPR data collection and analysis methods involve both quantitative and qualitative approaches. What distinguishes CBPR from other approaches to research is the active engagement of all partners in the process. This book provides a comprehensive and thorough presentation of CBPR study designs, specific data collection and analysis methods, and innovative partnership structures and process methods. This book informs students, practitioners, researchers, and community members about methods and applications needed to conduct CBPR in the widest range of research areas including social determinants of health, health disparities, health promotion, community interventions, disease management, health services, and environmental health.

"This book is a major contribution to the public health field. The editors are some of our most outstanding leaders in community-based participatory research." From the Foreword by David Satcher "Missing from the emerging field of University-community partnerships is a broad based discussion of methods for partnership formation and sustainability. This must-have edited volume is an important contribution to building the field. Based on federally funded collaborative research with multiple community stakeholders, it offers readers across disciplines and sectors a set of conceptual and practical tools and case materials for application and teaching." Jean J. Schensul, Ph.D., senior scientist and founding director, Institute for Community Research
