Andrea A. Rusnock : Vital Accounts: Quantifying Health and Population in Eighteenth-Century England and France (Cambridge Studies in the History of Medicine) before purchasing it in order to gage whether or not it

would be worth my time, and all praised *Vital Accounts: Quantifying Health and Population in Eighteenth-Century England and France* (Cambridge Studies in the History of Medicine):

This study examines the pre-history of statistics in eighteenth-century England and France, before state governments and other institutions began to collect statistical data on a regular basis. Eighteenth-century political and medical arithmeticians developed a variety of useful techniques to measure health and population. This book highlights the history of numerical tables, as new scientific instruments, and explains how they were used to evaluate smallpox inoculations, and the health and size of populations.

"An excellent overview of a vital, though hitherto neglected, dimension of eighteenth-century history." *The International History* "the wide range of issues raised by the author, and her ability to contextualize the complex web of interactions among science, institutions and social processes and to refute simplistic and essentialist views on 'the power of numbers', makes this a valuable contribution on the genesis of social statistics that any historian will benefit from reading." - Paul-Andre Rosental "Rusnock's book will be of value to historians of medicine and quantification as well as to those interested in the sociology of knowledge and the history of science and its social context more generally. Of particular interest is her comparative focus, which allows the book to escape an oversimplified view that sees scientific innovations such as quantification succeeding largely because they were 'right'. The different trajectory of medical quantification in these two countries--so well described by Rusnock--is a powerful argument in favor of a more complex and mult textured explanation, one that can take into account the important differences in the communities of researchers who first used numbers to measure the health and vitality of populations." - Joshua Cole, University of Michigan
